- *Rechargeable battery*
- *2 to 3 foot spread*

# Mini

The AG Mini bedding dispenser distributes hydrated lime and other disinfectant materials, giving an even and economical spread over a distance of 2 – 3 feet.

The Mini is driven by an electric motor, which is powered by a rechargeable battery giving up to two hours of continuous use.

The Mini is filled manually with bagged disinfectants and pulled by hand.

A positioned bolt can be easily moved to increase or decrease the distance of the material output

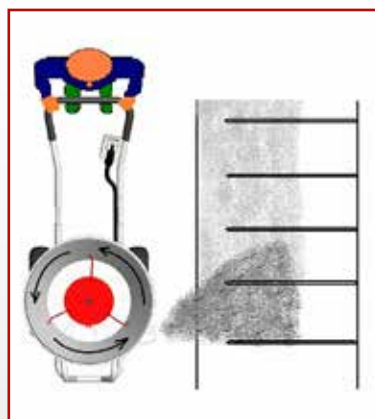

Easy to use with on/off switch on the machine handle

Easy access to the charge point on the machine handle

New solid handlebar inserts can be extended by loosening a bolt. This can change the handle length to suit users of different heights

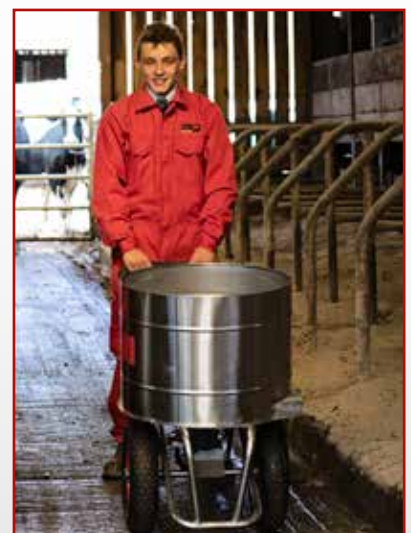

The material is distributed using 3 flexible polyurethane arms, which flick the material onto the cubicle beds

The battery operated flexible arms take no more than 6 hours to recharge

- Approximately 150 to 250 cubicles conditioned on one fill
- Consistent spread pattern regardless of user
- The battery can be constantly on charge when not in use so the machine is always ready to use

Drum capacity(L)	95
Distribution method	Flexible arms
Machine weight(kg)	33
Discharge height(m)	0.4
Discharge speed(L/min)	30
Spread distance(Ft)	2/3
